Highly Accelerated Stress Test System (HAST Chamber)
Creates temperature, humidity, and pressure environments to IEC60068-2-66 standard.

Humidity resistance evaluation tests for electronic components

Customers require test results that correlate accurately to those from the field in a minimal amount of time.

The Highly Accelerated Stress Test Chamber EHS Series offer high performance, functionality and ease of use, and are compliant with the international IEC60068-2-66 standard.

Many convenient functions and safety features are included for bias testing.
Improved Functionality and Ease-of-use for Bias Testing

- **The chamber interior is formed for easier specimen loading**
  
The pressure vessel is of spherical form which distributes pressure evenly and has superior strength. The test area is expanded to its maximum size to easily load printed circuit boards and other specimens.

- **The double stage model answers the need for diverse test conditions and large capacity (MD type)**
  
The units are designed so that the test condition of each chamber can be set individually, enabling this model to effectively reproduce diverse test conditions on a large number of specimens.

- **Customized racks that free complicated wiring**
  
  We can customize racks to fit the client's specimens to enable voltage and signal application, simply by setting a printed circuit board to the connector. We also offer sliding racks, for easier positioning and wiring of specimen. (optional)

- **Specimen signal terminals can be added depending on requirements**
  
The standard configuration is 12 specimen signal terminal pins. For double-stage type, 12 pins for each chamber. The EHS-211(M•MD) and 411(M•MD) can be expanded up to a maximum of 60 pins, in 12-pin units (optional), and the EHS-221(M•MD) to 72 pins for each chamber. (optional)
Even Greater Convenience and Safety

- **Easy program setting**
  Program capacity of 10 patterns with 30 steps per pattern. Simple operation using up and down keys for program setting, as well as adjustment of temperature, humidity and time values.

- **Safe and reliable door**
  The system employs a button operated automatic door locking mechanism. It prevents the door from being opened while the test chamber is pressurized.

- **Automatic humidifying water supply system**
  At the start of testing, the humidifying water needed for that test is automatically taken from a water tank. A slit on the front side allows the remaining amount of water in the tank to be checked at a glance.

- **Protection measures for specimen**
  Standard equipment includes a specimen power supply control terminal, which output contact signals to allow voltage and signals to be applied to the specimen during testing. When a problem occurs, specimens and chamber are fully protected. Power supply to the specimen is halted, and protection mechanisms for preventing overheating and boil-dry are activated.

- **Supports anxiety-free use**
  A variety of protective mechanisms include; overheat/overpressure protector, boil-dry protector, detection of water supply failure and incomplete door-lock, leakage breaker, and temperature sensor disconnection protector. The system also employs an external alarm terminal with an alarm buzzer and lamp. When a problem occurs, those in the vicinity are immediately warned.
Complies with IEC60068-2-66 standard testing while maintaining compatibility with conventional test methods

**Conforms to international IEC60068-2-66 standard**
- IEC60068-2-66 is an environmental testing standard of the IEC (International Electro-technical Commission). With ESPEC’s unique wet and dry bulb temperature control function, the EHS Series meets all requirements for test equipment and test operation specified in IEC60068-2-66.
- The EHS Series can also satisfy other test conditions of EIA/JED 4701, JEDEC and EIA/JESD22-A110-A as well as IEC.

* ESPEC was directly involved in drawing up the IEC60068-2-66 standard, and our technical concepts and measurement data were used in its development.

**Wet and dry bulb temperature control (M type) conforms to IEC60068-2-66 standard**

With ESPEC’s unique wet and dry bulb temperature control on M type chamber, temperature and humidity are measured directly using a wet and dry bulb temperature sensor. This ensures highly precise temperature and humidity control over the entire testing process, from before testing to the post-testing temperature decrease or hold process. After testing is complete, the temperature and humidity are allowed to drop for a fixed period. In the hold process, the chamber is kept at a fixed environment until the door is opened and specimens are removed. This makes it possible to place a specimen in a constantly controlled temperature/humidity environment, and keep it from drying after returning to atmospheric pressure.

**Free from pressure and temperature shock and drying of specimens after test**

In all control modes, abrupt changes in pressure and temperature after testing have been eliminated through mechanisms for gradual depressurization, and air/water discharge. This prevents vaporization of moisture contained in the specimen, and provide accurate test results in correlation to the field.

**Environmental Testing Centralized Control Software ERC-100M/300M (optional)**

The ERC-100M application software makes it easier to set test parameters, monitor operations, program, and process data for up to 16 ESPEC test chambers remotely, using a PC.

ERC-300M enables remote monitoring of up to 16 chambers and PC via Ethernet (Intranet).

* With the HAST Chamber, only monitoring is available.
* Pressure monitoring is not available.
* Up to 4 HAST Chambers can be connected.
* English software is available.
* Chambers must be equipped with an E-BUS port when using the software.
Control operation

Control functions to enable use of previous data

The control mode can be switched to match previous data.

M type:
- Wet and dry bulb temperature control
- Unsaturated control
- Wet saturated control

Standard type:
- Unsaturated control
- Wet saturated control

Three Modes of Operation Control

- **Wet and Dry Bulb Temperature Control (M type)**
  - The temperature and humidity gradient before and after testing can be controlled.
  - After testing is complete and chamber pressure reaches 0.010MPa (Gauge), only air is discharged; humidifying water is retained.
  - In the hold process, temperature and humidity inside the chamber are maintained at the specified level. (+50 to +95 / 75 to 95% RH)

- **Unsaturated Control (humidifying water temperature control)**
  - During temperature heat-up when condensation can easily occur on the reverse side of the specimen, the temperature of the humidifying water automatically increases while keeping it 30°C lower than the chamber temperature.
  - After testing is complete, the chamber is left to cool and depressurize naturally until chamber pressure reaches 0.010MPa (Gauge). Then both air and water are discharged.

- **Wet Saturated Control**
  - Chamber temperature is controlled through a humidifying heater. (chamber temperature = humidifying water temperature)
  - After testing is complete, the chamber is left to cool and depressurize naturally until chamber pressure reaches 0.010MPa (Gauge). Then only air is discharged; humidifying water is retained.

Do not use specimens which are explosive or inflammable, or which contain such substances. To do so could be hazardous, as this may lead to fire or explosion.

Be sure to read the instruction manual before operation.
