Speedy and Compact
High-Precision Thermal Tests Made Possible

This thermal-plate system has been developed to enhance heat conductivity to the specimen. When the specimen is placed on the thermal plate, the preset test heat is directly transmitted to the specimen due to its high heat conductivity. Furthermore, time savings have been achieved in preparations for the measurement of specimen characteristics. The applications of the system will extend from temperature-characteristic evaluations of optical devices, electronic components, FPDs, mounted PCBs, and the like to reliability evaluations, measurements in inspection processes, cell production systems, and so on. This is a new-style “Super Thermal Plate” for environmental tests that offers excellent heat characteristics in a compact body, and is capable of positively responding to the need for shorter test times.

*Viewing window and side table are optional.*
High heat conductivity to the specimen

A unique plate system has been developed that provides a temperature change rate up to 5 °C/min.*

As soon as the specimen is placed on plate, the heat is led to it, making it possible to reduce the time required for temperature-characteristic evaluations.

*Conform to the IEC-60068-3-5

Compatible with heat loads of 50W at -40°C

The system is applicable to specimen heat loads of 50W in the low-temperature range of -40°C, something that was practically impossible with conventional electronic cooling systems such as Peltier elements.

*Condensation may occur on the specimen and observation window at a temperature below room temperature. To avoid this, dry air must be introduced with the top cover closed.

Free access to the specimen

The desk-type module allows the specimen to be placed on the table, making it easy to conduct probing for electrical measurements, to observe the specimen under test or photograph it using a conventional camera or video camera.

High-precision measurements enabled

Access from the measurement instrument to the specimen can be performed simply across a flat table. This enables the measurement cable to be laid in the shortest distance and to be free from bends. The system is perfect for measuring optical fibers, and for conducting high-frequency measurements.

Side tables available for improved workability (Optional)

Use of the optional side tables (on both sides) allows measurement instruments and the like to be provided directly next to the specimen. When not in use, the side tables are folded back. (table size: 325W x 500D mm)
- **Large window for observation of a specimen (Optional)**
  
The specimen can be checked visually while a temperature-characteristic evaluation is underway. Changes in the specimen can thus be observed.

- **Equipped with a dry-air inlet for the prevention of condensation on the specimen**
  
  In a test conducted in a low-temperature range, condensation on the specimen adversely affects the test results. The system now comes equipped with an inlet port to introduce dry air into the test area, thereby preventing condensation on the specimen and viewing window.

  *Dry air must be provided by the customer.*

- **Equipped with a specimen temperature-monitoring function**
  
  This function enables monitoring of the specimen temperature simply by attaching a sensor to the specimen. The monitored temperature is indicated in the instrumentation section.

- **Perfect for cell production systems**
  
  The compact dimensions allow easy incorporation into a production-line process for flexible application to the temperature-characteristic evaluation of any cell product.

- **Environmental testing centralized control software ERC-200M (sold separately)**
  
  The application software allows centralized monitoring, control, and remote operation of up to 16 ESPEC chambers. You can drastically save time while your PC collects data for analysis and graphing.
New environmental testing "Super Thermal Plate". Extend applications into new directions.

- **Thermal plate system**
  Adopting a thermal plate system that transmits heat to the sample directly makes it possible to quickly heat up or cool down temperatures, thereby reducing the time required for temperature characteristic tests.

- **Free access to the sample**
  A desk type module and top door allows easy connections between the sample and measurement instrument to enable a broader range of evaluations. (Also allows sample observations and probing for electrical measurements over a wide range of temperatures.)

- **Compatible with heat loads (50W) at low temperatures**
  The compact body packs a powerful refrigerating circuit, capable of handling sample heat loads of 50W, even in the low temperature range of -40°C—formerly all but impossible with electronic cooling systems.

- **Perfect for cell production systems**
  Compact dimensions allow easy incorporation into a production line process for flexible application to temperature characteristic evaluation of any cell product.

**Temperature characteristic evaluations of ICs**

Characteristic evaluations are performed at each pin, with the IC mounted on the PCB being tested. □

□The package can be subjected to thermal stress when placed in close contact with the thermal plate.

**Temperature-frequency characteristic evaluations of high-frequency devices**

Measures the high-frequency characteristics of sample high-frequency devices while a certain temperature is applied to the devices. □

□Setup can be performed using very short high-frequency probe and measuring cables.

□Measurements can be performed into high-frequency domains using LCR meters and impedance analyzers.

**Tensile strength measurements for solder mounting**

Enables testing of the mounting strength of electronic devices and other components soldered to PCBs. □

□Tension tests in thermal environments.
Temperature characteristic evaluations of passive optical components

The temperature characteristics of passive optical components such as couplers and filters are evaluated and verified. □
□ Passive optical elements can be placed in a straight line without imposing loads on the fiber or other parts.
□ Incorporation of a temperature characteristic test into a cell production process increases production line efficiency.

Temperature characteristic evaluations of active optical modules

The temperature characteristics of active optical devices such as laser diode modules for optical communications are evaluated and verified. □
□ Active optical devices can be placed in a straight line without imposing loads on the fiber or other parts.

Optical characteristic evaluations of LEDs

The optical characteristics of light-emitting diodes are measured while they are subjected to heating. □
□ Since the thermal load is applied to the sample while it is positioned on the thermal plate, no part other than the sample is affected by temperature variations. This makes it possible to position the camera or other measurement device close to the diode being measured.

Fault analysis of mounted PCB under thermal stress

Fault of a mounted PCB can be reproduced or waveforms can be checked while subjected the PCB to constant or varying temperatures. □
□ Manual probing is also possible. (Condensation may occur at low temperatures if the equipment is left exposed.)

Temperature characteristic evaluations of active optical modules

Temperature characteristic evaluations of flat panel display, including TFT color LCDs and organic ELDs.
□ A CCD camera or other apparatus can be installed on top of the panel.
□ Luminance, chromaticity, field angle, and other characteristics can be evaluated while subjecting the sample to a specific temperature.

Fault analysis of mounted PCB under thermal stress

Fault of a mounted PCB can be reproduced or waveforms can be checked while subjected the PCB to constant or varying temperatures. □
□ Manual probing is also possible. (Condensation may occur at low temperatures if the equipment is left exposed.)

Example is image of usage of the Super Thermal Plate.

</table>

<sup>1</sup>The conditions for performance measurement are detailed in the product specification, which is available upon request.

<sup>2</sup>Measured when there is no specimen in place and no air flow, applied with rated voltage at an ambient temperature of +23°C.

<sup>3</sup>Difference between the average maximum temperature and average minimum temperature at the dimensional center of the plate.

<sup>4</sup>Temperature difference at an arbitrary point of the effective testing area.

<sup>5</sup>Conforms to IEC60068-3-5.

<sup>6</sup>Conforms to IEC60068-3-5.

(Performance method: Measure temperature from the minimum temperature to the maximum temperature and from the maximum temperature to the minimum temperature within the specified temperature range, and determine the rate of temperature change for the temperature-change time during which monitoring was conducted between 10% and 90% of that temperature range.)

*5 Excluding protrusions.

---

**DANGER:**
- Do not use specimens which are explosive or inflammable, or which contain such substances. To do so could be hazardous, as this may lead to fire or explosion.
- Do not place corrosive materials in the test area. If corrosive substances or humidifying water is used, the life of the unit may be significantly shortened.
- Do not place life forms or substances that exceed allowable heat generation.

**CAUTION:**
Be sure to read the instruction manual before operation.
SAFETY DEVICES
- Leakage breaker for power supply
- Thermal fuse
- Specimen power supply control terminals
- Refrigerator overload relay
- Short circuit protection fuse for control circuit
- Door switch
- Temperature switch
- SSR overload & short circuit protecting circuit breaker
- Overload relay for condenser heat exhaust fan
- Refrigerator high pressure switch
- Reverse prevention relay
- Electric parts compartment door switch
- Compressor temperature switch
- Refrigerator overload relay
- Specimen power supply control terminals
- Thermal fuse

DIMENSIONS

unit: mm (inch)
**OPTIONS**

**Additional overheat protector**

In addition to the upper temperature alarm function and overheat protector, both provided as standard equipment, an additional temperature overheat protector is included.

**Overcool protector**

Prevents the plate temperature from falling abnormally.

**Emergency stop switch**

In emergency stop status, this switch shuts off power to the Super Thermal Plate.

---

**Specimen temperature monitor sensor**

Measures the temperature of specimen.
- Thermocouple type T (Copper/Copper-Nickel)

**Communication functions**

Computer interface.
- GP-IB
- RS-232C
*Select one other than standard RS-485.

**Communication cable**

- RS-485 5, 10m
- GP-IB 2, 4m
- RS-232C 1.5, 3, 5, 10m

**Viewing window**

Glass window with a defogger for conducting visual checks of the specimen on the plate.
- Window size: 170W \( \times \) 305Dmm

---

**Side tables (On either side)**

Table for arranging measuring instruments, power supplies, and the like close to the plate.
- Size: 325W \( \times \) 500Dmm
  (One on each side)
- Load capacity: 30kg (Equally distributed load)

---

**Thermally conductive sheet**

The thermally conductive sheet improves the contact between specimens and the specimen plate.
- Size: 200W \( \times \) 290Dmm
- Sheet thickness: t1.0, t3.0 mm

**Power cord**

Used when a cord longer than normal (2.5 m) is required.
- 5, 10m
